```
Unknown command !
h
System Halted !
h[1]

Help page #1 - Command Interpreter Overview: ------------

c[x]     - "Execute Command #x"      (may include parameters)
s[x]     - "Read a Status Set"       (no parameters, read only)
d[x]     - "Data Set", R/W           (if W, command followed by = data.)
m[xxxx]  - "I/O,SFR,Mem.,@[addr],"R/W (if W, command followed by = uint8_t.)
h[x]     - "Display help page"       (Page# = x)

h        - "h" or "H" halts (and resets) the system.

Notes:

x        = uint_8t , index range 0 to 255.
xxxx     = uint_32t, address range 0x00000000 to 0xFFFFFFFF

Codes c,s and d are made more specific by adding [x].
Exactly what they do will be determined by enumeration of [x].

Code m directly reads/writes the address space of the processor,
(possibly with some restrictions).
